TEAR RESISTANT & RIP PROTECTION BELTS

An ISO 9001:2015 Certified Company

In some critical conveyor installations, there are cases where the normal expected belt life significantly deteriorates due to premature failure caused by longitudinal thorough cut, tear or carcass fracture. These belts normally convey large sized lumps and are used in heavy duty mining applications.

Failures are catastrophic and impose heavy financial losses due to stoppage of production and downtime.

For such applications demanding the highest impact, rip and tear resistance, KBPL recommends SPECIAL TEAR & RIP RESISTANT GRADE BELTS with Special Fabric or Steel Breaker Mesh to avoid damage to the carcass

BENEFITS:

- High Resistance to Extreme impact loads.
- Low elongation at working load resulting in trouble free operation
- High Tear resistance
- Excellent Load support and troughability
- Very good longitudinal flexibility
- Excellent suitability to mechanical splicing
- Energy saving due to lower weight
- Comes with special Fabric or Steel Mesh to prevent Damage to the carcass

I respect my customer, stakeholder & environment.
